

Power Iteration Method

- Given a web graph with N nodes, where the nodes are pages and edges are hyperlinks
- **Power iteration:** a simple iterative scheme

- Suppose there are N web pages

- Initialize: $\mathbf{r}^{(0)} = [1/N, \dots, 1/N]^T$

- Iterate: $\mathbf{r}^{(t+1)} = \mathbf{M} \cdot \mathbf{r}^{(t)}$

- Stop when $\|\mathbf{r}^{(t+1)} - \mathbf{r}^{(t)}\|_1 < \varepsilon$

$\|\mathbf{x}\|_1 = \sum_{1 \leq i \leq N} |x_i|$ is the \mathbf{L}_1 norm

Can use any other vector norm, e.g., Euclidean

$$r_j^{(t+1)} = \sum_{i \rightarrow j} \frac{r_i^{(t)}}{d_i}$$

d_i . out-degree of node i

PageRank: How to solve?

■ Power Iteration:

- Set $r_j = 1/N$
- **1:** $r'_j = \sum_{i \rightarrow j} \frac{r_i}{d_i}$
- **2:** $r = r'$
- If not converged: goto **1**

	y	a	m
y	$\frac{1}{2}$	$\frac{1}{2}$	0
a	$\frac{1}{2}$	0	1
m	0	$\frac{1}{2}$	0

$$\mathbf{r}_y = \mathbf{r}_y/2 + \mathbf{r}_a/2$$

$$\mathbf{r}_a = \mathbf{r}_y/2 + \mathbf{r}_m$$

$$\mathbf{r}_m = \mathbf{r}_a/2$$

■ Example:

$$\begin{bmatrix} \mathbf{r}_y \\ \mathbf{r}_a \\ \mathbf{r}_m \end{bmatrix} = \begin{bmatrix} 1/3 \\ 1/3 \\ 1/3 \end{bmatrix}$$

PageRank: How to solve?

■ Power Iteration:

- Set $r_j = 1/N$
- 1: $r'_j = \sum_{i \rightarrow j} \frac{r_i}{d_i}$
- 2: $r = r'$
- If not converged: goto 1

	y	a	m
y	1/2	1/2	0
a	1/2	0	1
m	0	1/2	0

$$\mathbf{r}_y = \mathbf{r}_y/2 + \mathbf{r}_a/2$$

$$\mathbf{r}_a = \mathbf{r}_y/2 + \mathbf{r}_m$$

$$\mathbf{r}_m = \mathbf{r}_a/2$$

■ Example:

$$\begin{bmatrix} \mathbf{r}_y \\ \mathbf{r}_a \\ \mathbf{r}_m \end{bmatrix} = \begin{array}{ccccccc} 1/3 & 1/3 & 5/12 & 9/24 & & 6/15 \\ 1/3 & 3/6 & 1/3 & 11/24 & \dots & 6/15 \\ 1/3 & 1/6 & 3/12 & 1/6 & & 3/15 \end{array}$$

Iteration 0, 1, 2,

Random Walk Interpretation

- **Imagine a random web surfer:**

- At any time t , surfer is on some page i
- At time $t + 1$, the surfer follows an out-link from i uniformly at random
- Ends up on some page j linked from i
- Process repeats indefinitely

- **Let:**

- $\mathbf{p}(t)$... vector whose i^{th} coordinate is the prob. that the surfer is at page i at time t
- So, $\mathbf{p}(t)$ is a probability distribution over pages

The Stationary Distribution

- Where is the surfer at time $t+1$?

- Follows a link uniformly at random

$$p(t+1) = M \cdot p(t)$$

- Suppose the random walk reaches a state

$$p(t+1) = M \cdot p(t) = p(t)$$

then $p(t)$ is **stationary distribution** of a random walk

- Our original rank vector r satisfies $r = M \cdot r$

- So, r is a stationary distribution for the random walk

Existence and Uniqueness

- A central result from the theory of random walks (a.k.a. Markov processes):

For graphs that satisfy **certain conditions**, the **stationary distribution is unique** and eventually will be reached no matter what the initial probability distribution at time $t = 0$
